Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role focused on Fleet Connectivity. I bring hands-on experience operating cloud infrastructure, building Terraform-based networking, and automating application releases. The opportunity to help shape infrastructure for a new train-to-cloud platform particularly appeals to me because it combines cloud design, networking, security, and dependable operations.

At Havenstad Logistics, I work in a three-person cloud team operating an Azure estate of approximately 400 virtual machines and 12 AKS clusters across three subscriptions. I have developed Terraform modules for hub-and-spoke networking, Azure Firewall, and private endpoints, and migrated release pipelines for 15 internal applications to Azure DevOps YAML. Earlier, as a Systems Administrator, I led the lift-and-shift migration of 60 VMware-hosted servers to Azure IaaS and automated user provisioning and patch reporting with PowerShell.

This experience has given me a practical foundation in cloud infrastructure, systems administration, networking, and security. In freelance work, I also established backups and basic security baselines—including MFA and conditional access—for small businesses. I would bring that combination of infrastructure engineering and operational focus to Corvale's work on secure, observable, and reliable fleet connectivity, while contributing to the collaborative, end-to-end ownership described in the role.

I would welcome the opportunity to discuss how my experience with Azure, Terraform, cloud networking, and release automation could support Corvale Mobility's fleet connectivity platform. Thank you for your consideration.

Sincerely,

Samuel Achterberg-Osei
