Dear Tessel Cargo Software team,

I'm applying for the Backend Engineer role on the Shipment Tracking Platform. I'm a full-stack engineer with professional web development experience since 2014, and I've built and maintained production backend services using Node.js, TypeScript, NestJS and Express. Tessel's focus on dependable, timely shipment information and engineering teams that own what they run particularly appeals to me.

In my current onboarding role at Älvgrind Fintech, I build and maintain Node.js backend services and REST APIs with PostgreSQL, Docker and AWS, and contribute to automated testing and CI/CD through Jest, Playwright and GitHub Actions. I helped build a BankID identity-verification flow that increased onboarding conversion from 61% to 74%, and a secure document-upload service using S3, Lambda and SQS. I also participate in a one-week-in-six on-call rota and helped migrate our backend incrementally from Express to NestJS, route by route behind the same API gateway. These projects have given me experience improving production services while making changes carefully and incrementally.

My professional backend experience is primarily in Node.js and TypeScript rather than Python, with production experience in REST services, PostgreSQL, Docker, AWS, automated testing and CI/CD; my Python experience so far is limited to small personal Home Assistant integrations. I would bring a strong foundation in backend development and relational databases, alongside practical experience with reliability, testing and delivery. I have also worked with Sentry and Datadog as part of monitoring and investigating production behaviour. Earlier in my career, I was technical lead for most of a React Native ferry-ticket application that reached approximately 50,000 downloads, giving me direct exposure to transport software and customer-facing ticketing flows. I also shared what I learned from our Express-to-NestJS migration in a talk at a local JavaScript meetup. English is my work language, and I have explained technical decisions to an external audience through my Express-to-NestJS migration talk.

Thank you for considering my application. I would welcome the opportunity to discuss how my Node.js backend, PostgreSQL, AWS, testing, and operational-reliability experience could contribute to Tessel's Routing & Tracking team.

Best regards,
Oskar Haddad-Lindqvist
