Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. The role's focus on hands-on infrastructure engineering, cloud environment design and operation, reliable interfaces, and observability closely matches my experience building and operating AWS platforms.

At Tallybrook, I am the technical lead for a five-person platform team operating eight EKS clusters across three regions and supporting approximately 350 services. I designed and built a self-service developer platform using service templates, Argo CD and Crossplane, helping product teams take a new service to production in under a day rather than around two weeks. The platform was adopted by all 14 product teams. I also introduced SLOs and burn-rate alerts for critical services and agreed an error-budget policy with product leadership, contributing to a roughly 60% reduction in on-call pages. Through that policy, I brought product stakeholders into reliability decisions. This work involved designing platform interfaces, self-service infrastructure, and an operating model that product teams use from service creation through production, giving me practical experience translating platform design decisions into an operable system.

Previously, at Brightwater Games, I carried out hands-on AWS infrastructure engineering using Terraform and Atlantis, managing approximately 40 Terraform modules and pull-request-based plan/apply workflows for game backends serving up to 1.2 million daily active players. I led capacity planning for two major launches and used load testing to identify and fix a connection pool limit before launch. That work reinforced the value of testing assumptions early and making infrastructure understandable to the teams who depend on it. Earlier, I managed approximately 600 Linux servers and automated operational tasks in Bash and Python, which gave me a practical foundation in systems operation.

Corvale's need to shape a reliable, observable cloud platform from system design through production is a strong match for my experience leading platform work, making infrastructure self-service, supporting product teams, and establishing operational practices that scale. I would welcome the chance to discuss how my cloud infrastructure, technical leadership, stakeholder-engagement, and reliability experience could support the team from design through production.

Best wishes,
Nadia Brennan-Aziz
