Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and a track record of designing, building and operating reliable AWS cloud platforms in production. Corvale's plans to connect its new train fleet with cloud services make this an especially compelling opportunity to apply that experience to a new, end-to-end system.

At Tallybrook, I lead a five-person platform team operating eight AWS EKS clusters across three regions and approximately 350 services. I built an internal developer platform using service templates, Argo CD and Crossplane-based self-service provisioning, reducing the time to take a new service to production from around two weeks to under a day. This involved defining practical platform patterns, self-service interfaces and operational defaults that product teams could adopt consistently. I also introduced SLOs and error budgets for critical services, reducing weekly on-call pages by approximately 60%, and moved node provisioning to Karpenter with spot instances, reducing EC2 spend by 38%. These experiences have developed my ability to lead technical work, create practical infrastructure foundations, and help service teams build systems that are observable and operable.

My background also includes managing AWS infrastructure as code in Terraform across approximately 40 modules, using Atlantis for pull-request plan and apply workflows. I have operated systems at scale, replaced noisy monitoring with a Prometheus, Grafana, Alertmanager and Loki stack, and supported capacity planning for game launches serving up to 1.2 million daily active players. Alongside this, my experience with AWS VPC and IAM, Linux operations, incident management and technical leadership gives me a strong foundation for contributing to the cloud infrastructure around Corvale's train-to-cloud platform. I would contribute to system design and technical proposals while helping product teams build services that are observable and operable.

I would welcome the opportunity to discuss how my platform engineering and AWS experience could support Corvale Mobility as it builds reliable, observable cloud infrastructure for its fleet connectivity services. Thank you for your consideration.

Yours sincerely,

Nadia Brennan-Aziz
