Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. I'm a Senior Platform Engineer and platform team tech lead with hands-on experience designing and operating AWS infrastructure, building Kubernetes platforms, and using Terraform to make infrastructure repeatable and maintainable.

At Tallybrook, I led the development of an internal developer platform adopted by all 14 product teams, reducing the time to take a new service to production from around two weeks to under one day. I also established SLOs and burn-rate alerting for 20 critical services, working with product leadership on an error-budget policy. Earlier, at Brightwater Games, I built and operated AWS infrastructure with Terraform and led capacity planning for major launches. Ahead of one launch, k6 testing of 300,000 concurrent players exposed a connection-pool limit that we resolved before production. These experiences have taught me to connect system design decisions with the practical needs of teams operating services reliably.

Corvale's work to connect a new train fleet with cloud services calls for thoughtful infrastructure design, clear technical proposals and dependable operations. I would bring experience leading technical work across platform and product teams, and a focus on building infrastructure that is observable, reliable and straightforward to operate. I'm particularly drawn to Corvale's engineering-led approach and its emphasis on teams owning their systems end to end.

I'd welcome the opportunity to discuss how my infrastructure and reliability experience could support Corvale's fleet connectivity work.

Best wishes,

Nadia Brennan-Aziz
