Dear Hiring Manager,

I am applying for the Machine Learning Engineer – Customer Support AI role at Quillstone Payments. With six years in analytics and data science, including more than four as a data scientist, I bring experience building models used by operational teams and translating business questions into actionable analyses.

At Thistlebox, I built a LightGBM model to forecast weekly demand for individual recipes, using calendar features to support ingredient ordering. The model reduced forecast error from 23% to 14% and estimated food waste by 9%. I also built an XGBoost churn propensity model used to target retention offers and evaluated its uplift using a holdout set. Alongside this work, I write production SQL in BigQuery and maintain dbt models for the analytics layer.

My background combines Python, feature engineering and statistical evaluation with an MSc in Statistics. I design and analyse around 40 A/B tests a year and present results to leadership monthly. I am interested in moving further into machine learning engineering, and Quillstone's work on models and assistants that help merchants and support agents is a compelling application of that direction. The opportunity to work with engineers, data scientists and product managers also aligns with the practical, team-based work described in the role.

I would welcome the opportunity to discuss how my modelling, evaluation and analytics engineering experience could contribute to your Customer Support AI team. Thank you for your consideration.

Yours sincerely,

Tobias Mwangi-Hartley
