Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role because it brings together production backend engineering, dependable tracking services and practical work on event-driven systems. Tessel's focus on reducing the effort dispatchers spend chasing shipment updates makes the reliability of its tracking platform especially meaningful.

I bring 21 years of experience building backend services and distributed systems in Python, Go and C++. At Streamhaus, I designed and wrote most of a Go entitlement service that handled 120,000 requests per second at peak, and led technical work on the playback API. I also helped migrate a Python 2 monolith into around 60 Python and Go services, improving playback API availability from 99.5% to 99.95%. Earlier, I built fleet-telematics systems ingesting GPS data from 300,000 vehicles, using Python, PostgreSQL/PostGIS and RabbitMQ—a background closely related to processing shipment events reliably.

My experience includes Python APIs, PostgreSQL, Kafka, automated testing with pytest and tox, and operating services with Kubernetes, Terraform and observability tooling. I have also documented architecture and contributed to service standards and on-call guidelines. After leading an engineering organisation, I am now looking to return to hands-on individual-contributor backend work, where I can contribute directly to building and improving production services.

I would welcome the opportunity to discuss how my backend and reliability experience could contribute to Tessel's Routing & Tracking team. Thank you for your consideration.

With best regards,
Rafael Moretti-Klein
