Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role on the Fleet Connectivity team. I bring hands-on experience designing and operating Azure infrastructure, building Terraform-based networking, and improving deployment automation. Corvale's work to shape the cloud platform for its new train fleet is a compelling opportunity to apply that experience to infrastructure being built for production from the start.

In my current contract, I am part of a three-person cloud team operating an Azure estate of approximately 400 virtual machines and 12 AKS clusters. I designed reusable Terraform modules for hub-and-spoke networking across three subscriptions, including Azure Firewall, private DNS zones, private endpoints and VNet peering. I also added Terraform module tests and a nightly infrastructure drift-detection job, and replaced manual deployments for 15 applications with Azure DevOps pipelines. These projects have strengthened my focus on infrastructure that is maintainable, testable and reliable in operation.

Earlier, as a systems administrator for municipal services, I led the technical delivery of a migration of 60 VMware servers to Azure IaaS. The cutover was completed over six weekends without unplanned downtime. My experience also includes network and Active Directory escalation, site-to-site VPNs, and practical security work such as implementing MFA and Conditional Access for small businesses. I hold the Azure Administrator Associate and Terraform Associate certifications.

That work required leading the technical delivery from planning through cutover and coordinating the infrastructure changes needed to keep municipal services available.

I would welcome the opportunity to discuss how my cloud infrastructure, networking, systems-design and automation experience could support Corvale's fleet connectivity platform and its engineering-led, collaborative approach to owning systems end to end.

Kind regards,

Samuel Achterberg-Osei
