Dear Verdane Care team,

I have 12 years of professional experience building web and mobile applications. Since 2021, I've worked on onboarding features at Älvgrind Fintech using React, TypeScript, NestJS and PostgreSQL. My strongest area is frontend development, and I also bring hands-on experience building Node.js services with NestJS and Express, working with PostgreSQL, and handling data-sensitive workflows.

A project especially relevant to Verdane Care's patient-facing work is an identity-verification step using Swedish BankID, with both QR-code and same-device flows. We tested it with 10% of traffic before rollout, and onboarding conversion increased from 61% to 74%. I also built a secure ID-document upload flow using S3 presigned URLs, virus scanning and status updates. These projects gave me practical experience building important user journeys in a privacy-sensitive fintech context, with identity verification, secure document handling, and careful protection of personal information.

I'm drawn to Verdane Care's focus on making healthcare feel more human, and to principles such as "Patients first" and "Privacy by default." Earlier in my career, I led the technical delivery and built most of a React Native ferry-ticket app for purchasing and showing tickets offline; it reached approximately 50,000 downloads. That experience strengthened my interest in building useful, dependable experiences for people using mobile products.

I'd welcome the opportunity to bring my React and TypeScript experience, Node.js and PostgreSQL backend background, and experience building user-facing features to the Patient Experience team. Thank you for considering my application.

Best regards,
Oskar
