Dear Hiring Manager,

I am applying for the Machine Learning Engineer – Customer Support AI role at Quillstone Payments. I bring more than five years of experience across machine learning and data science, with hands-on work taking NLP systems from text preparation and model development into deployment and production monitoring.

At Slavonica Document AI, I built and deployed document classification and named entity recognition models for Croatian administrative texts. The document classifier serves approximately 15,000 documents per day, and I use MLflow for experiment tracking and model registry, with FastAPI and Docker on Azure App Service for serving. I have also implemented production drift monitoring; one monitoring workflow detected an OCR change associated with a 9-point accuracy drop, and the issue was fixed within a week. Earlier, I classified customer complaints into 11 topics to support weekly reporting for customer service management, experience relevant to AI that routes and helps resolve support requests.

I have also built a personal, non-production RAG prototype for question answering over Croatian laws, using sentence-transformer embeddings, FAISS, and an open-weight LLM through an API. My production work has focused on transformer models such as XLM-R and BERTić; the RAG demo was a weekend prototype, not a production assistant. I would bring this practical NLP and deployment experience to Quillstone's work building AI systems that help merchants and support agents.

I would welcome the opportunity to discuss how my experience in production NLP, model serving, and monitoring could contribute to the Customer Operations AI team. Thank you for your consideration.

Sincerely, Petra Zlatarić-Novosel
