Dear Corvale Mobility hiring team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. The opportunity to help shape the cloud infrastructure for Corvale's new train fleet—from vehicle connectivity through to reliable backend services—aligns closely with my experience building and operating AWS platforms for production systems.

As technical lead of Tallybrook's platform team, I run an EKS platform across eight clusters and have built an internal developer platform used by all 14 product teams. By combining service templates, Argo CD GitOps and Crossplane self-service for AWS services, we reduced the time to take a new service to production from approximately two weeks to under one day. I also work across reliability and operational readiness: our SLO programme reduced on-call pages by approximately 60%, and I established the incident and post-mortem process.

My earlier experience at Brightwater Games includes hands-on AWS infrastructure engineering with Terraform, observability using Prometheus and Grafana, and load testing and capacity planning for game launches. Across these roles, I have focused on practical infrastructure that is approachable for developers and dependable in production. My AWS experience also includes VPC and IAM, alongside Linux systems administration and automation with Go, Python and Bash.

I would welcome the opportunity to discuss how my platform, infrastructure-as-code and reliability experience could contribute to Corvale's fleet connectivity work. Thank you for your consideration.

Best wishes,
Nadia Brennan-Aziz
