Tessel Cargo Software
Routing & Tracking team

Dear Hiring Team,

I am applying for the Backend Engineer (Python) position. Turning carrier events into a dependable live tracking API calls for the kind of work I do at Tejo Insurance Tech: designing partner-facing APIs, making event processing reliable and running services in production. I want to move into a Python-focused stack, bringing production experience in Java and Kotlin; my Python use so far has been data-fix scripts and small Jenkins helpers rather than deployed services.

At Tejo, I designed a versioned REST API used by 12 broker partners for approximately 400,000 quote requests per month, with per-partner rate limiting and contract tests. I also reduced quote endpoint p99 latency from 1.8 seconds to 450 milliseconds through Redis caching and JPA query fixes. For our Kafka-based claims workflow, I implemented a transactional outbox and idempotent consumers: duplicate claims fell from approximately 40 per week to zero over the following quarter. These are directly relevant foundations for improving the reliability of your carrier-event ingestion and customer-facing tracking API.

I also bring experience operating services on AWS EKS through Helm and Jenkins pipelines, with on-call responsibility one week per month. I handled a major Kafka lag incident in March 2024 and wrote an incident report that was praised. At Viajar Online, I increased payments module test coverage from 35% to 70% using Testcontainers. Alongside delivery, I have written Kotlin coding guidelines and run fortnightly backend guild meetings in an English-speaking team. This experience fits your emphasis on automated testing, clear technical communication and engineers owning what they run.

I would welcome a conversation about how my API, Kafka and production reliability experience could support Tessel's Routing & Tracking team as I make the transition to Python. Thank you for considering my application.

Best regards,
Daniel Okafor-Reyes
