## Rafael Moretti-Klein

Application: Backend Engineer (Python) - Shipment Tracking Platform
Tessel Cargo Software

Dear Tessel Cargo Software hiring team,

I am applying for your Backend Engineer role because its focus on Python services and API reliability fits the hands-on individual-contributor work I want to return to. I left Streamhaus in August 2026 following a reorganisation, after serving as Principal Engineer and then Director of Engineering. This is a deliberate move back to building software, rather than a search for another management position.

As Principal Engineer, I designed and wrote most of a Go entitlement service that handled 120,000 requests per second at peak with p99 latency below 15 ms. I was also technical lead for the playback API. Later platform work included a migration from a Python 2 monolith to approximately 60 Python 3 and Go services on GKE. I set up service templates incorporating FastAPI, OpenTelemetry, Prometheus and Terraform; playback API availability improved from 99.5% to 99.95% during the migration. That experience is relevant to improving the performance and reliability of your customer-facing tracking API.

My recent coding has focused on internal tools and Python cost-dashboard scripts, rather than sustained product-service development. Python remains current, and my cloud experience is primarily GCP, with limited earlier exposure to AWS EC2 and S3. I would bring practical experience with Kubernetes, infrastructure as code and service observability to your Python backend work. Your team's short design notes and dedicated reliability work provide a concrete setting in which that experience could contribute.

I would welcome a technical conversation about the entitlement service or the migration, including the design trade-offs and reliability improvements. Thank you for considering my application.

With best regards,
Rafael Moretti-Klein
