Verdane Care
Application: Full-Stack Engineer (TypeScript / React) – Patient Experience

Dear Verdane Care Hiring Team,

Your Patient Experience role closely matches my work building customer-facing onboarding journeys with React, TypeScript, NestJS and PostgreSQL. At Älvgrind Fintech, I have improved identity verification, accessibility and mobile performance across the frontend and backend. That experience offers a practical foundation for Verdane Care's appointment-booking and intake features, where completing a task easily and reliably matters to the person using the software.

I built a BankID verification flow covering QR codes, error states and retries; onboarding conversion increased from 61% to 74%. We A/B tested the flow with 10% of traffic before rolling it out fully. I also reduced mobile Largest Contentful Paint from 4.1 to 1.9 seconds and implemented WCAG 2.1 AA audit fixes. These are directly relevant foundations for your focus on low-end phones and WCAG 2.2 AA, without treating accessibility and performance as separate from feature delivery.

My backend work includes migrating Express services to NestJS and building document uploads with S3 presigned URLs, ClamAV scanning in Lambda, and status handling through SQS and PostgreSQL. My current stack also includes Jest, Playwright, Docker and GitHub Actions, alongside Storybook and Next.js for marketing pages. I collaborate with designers in Figma, participate in production on-call support, and previously mentored coding bootcamp students. This combination fits the breadth of a small squad delivering features end to end.

Verdane Care's React-based design system and independently audited patient app provide a concrete setting for this experience. I would welcome a conversation about how my work improving onboarding journeys could contribute to simpler booking and intake experiences for your patients.

Kind regards,
Oskar Haddad-Lindqvist
