Halden Pay
Data Platform Hiring Team

Application: Senior Data Engineer – Data Platform

Dear Hiring Team,

In my current engineering role, I developed Python scripts that reduced test-report preparation from about three days to half a day per test by automating data processing, specification checks and report figures. I am applying for Halden Pay's Senior Data Engineer – Data Platform role as a mechanical engineer transitioning into data engineering, bringing practical Python and SQL experience and 12 years in product design and test & validation.

At Corvane Automotive Components, I use pandas, NumPy and Matplotlib to turn test-rig output files into consistent reports, checking every channel against the relevant test specification. I also query the plant's SQL Server database to analyse trends across three product generations. These tasks require translating engineering requirements into repeatable checks and outputs that support decisions. Alongside this work, I lead 8D root-cause analysis on field failures; a bracket redesign I proposed reduced warranty returns for that part by 40%.

Halden Pay's emphasis on reusable frameworks rather than one-off pipelines connects with the repeatable processing and reporting approach I have applied to test data. My experience is in engineering-data workflows rather than production cloud data platforms, but it provides a concrete foundation in Python automation, SQL analysis and specification-based validation. Your focus on data quality is particularly relevant to my work checking measured data against defined requirements, while your Ownership value aligns with my responsibility for investigating failures and proposing corrective changes.

I would welcome a discussion about how this background could contribute to the Data Platform team and how my experience fits the scope of the role. I offer fluent English and native Portuguese, together with a record of using data and automation to improve engineering work. Thank you for considering my application.

Yours sincerely,
Tiago Ferrão-Lindqvist
