COVER LETTER

Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer – Data Platform position. In my current test and validation role, I have built practical data tools that turn test-rig outputs into checked results and reports used by other engineers—experience that has motivated my move toward data engineering.

At Corvane Automotive Components, I developed Python scripts using pandas, NumPy, Matplotlib and npTDMS to process TDMS and CSV files from six test rigs, validate channels against specifications and generate report figures. The tool handles about 2 GB of data each week, runs nightly on a lab PC, and is used by four other test engineers; it cut report preparation from about three days to half a day per test. I also query SQL Server test data for trends and built a Power BI dashboard used by around 15 validation and design engineers. These projects have taught me to make data outputs useful and dependable for the people relying on them.

My experience so far is with lab-based tools rather than a cloud data platform, and I have not used Google Cloud, Airflow or dbt professionally. I am developing my data engineering knowledge through an online course, of which I have completed six of nine modules, and through personal projects. Halden Pay's focus on shared, reusable platform frameworks and its values of ownership, collaboration and simplifying work appeal to me as I build on my engineering and data-tooling background.

I would welcome the opportunity to discuss how my experience building practical data tools, working with engineering users and learning new technologies could contribute to Halden Pay's Data Platform team.

Best regards,
Tiago Ferrão-Lindqvist
