Dear Hiring Team at Halden Pay,

I am applying for the Senior Data Engineer – Data Platform role. I have spent nine years building and operating data systems across logistics, e-commerce and payments, with a focus on reliable platform foundations that analysts and product teams can trust.

At Lukovac Freight Hub, I own ingestion and orchestration for a platform with approximately 140 Airflow DAGs, and I led the migration of warehouse transformations to dbt. That work reduced the nightly build from 5 hours 10 minutes to 1 hour 35 minutes. I also introduced data contracts with CI checks, helped reduce broken-pipeline incidents, and built Kafka streaming and Debezium CDC pipelines. These projects reflect the platform ownership, data quality and reusable engineering practices described in your role.

My experience includes production-scale cloud data work on AWS, as well as Snowflake and Redshift warehousing, Python, SQL, Docker and GitHub Actions. At Kovalent Pay, I built PySpark reconciliation jobs on EMR and designed dimensional warehouse models for finance and risk. I have also contributed fixes and tests to an open-source Airflow provider. My production cloud experience is on AWS rather than Google Cloud, but it gives me a strong foundation in operating managed data and compute services.

I am drawn to the role's emphasis on a shared data platform and reusable frameworks for analysts, data scientists and product teams. I would welcome the opportunity to discuss how my experience with platform operations, data contracts and batch and streaming systems could contribute to Halden Pay's Data Platform team.

Kind regards, Lena Varga-Holm
