Tiago Ferrão-Lindqvist

Dear Hiring Manager,

I am applying for the Senior Data Engineer – Data Platform role at Halden Pay. Over 12 years in mechanical engineering, I have increasingly focused on making test data reliable, reusable and useful for engineering decisions—most recently by building Python-based processing and reporting tools.

At Corvane Automotive Components, I developed scripts that process test-rig files, validate channels against specifications and generate standard report figures. The tool runs nightly, writes summaries to a staging table in SQL Server and is now used by four other test engineers. I also built a Power BI dashboard used by about 15 validation and design engineers to explore pass/fail trends and cycles to failure. These projects have given me hands-on experience turning users' needs into repeatable data workflows and reporting.

My experience so far is in engineering test-data workflows rather than operating a cloud data platform at scale, and I have not yet used Google Cloud, Airflow or dbt. I am building on my Python and SQL experience through an online data engineering course, of which I have completed six of nine modules, and a personal Flask and SQLite API project. Halden Pay's focus on shared, reusable platform frameworks is the kind of data engineering work I am aiming to move into.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience building practical data tools and supporting their use by engineering teams could contribute to Halden Pay's Data Platform team.

Best regards,
Tiago Ferrão-Lindqvist
