Dear Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. With seven years in QA automation, I have increasingly focused on infrastructure that helps product teams deliver reliably. At Odrava Health Software, I own GitLab CI pipelines for three teams and built merge-request environments on a shared Kubernetes cluster.

I improved average pipeline time from 38 to 14 minutes and monthly CI runner costs by about 30%, and helped reduce flaky tests from 7% to below 1%. I also documented the CI system for onboarding and mentored two QA interns.

My personal k3s homelab uses Argo CD, Prometheus, Grafana, Loki, Traefik and cert-manager; I also used Terraform to provision a small Hetzner VPS. My production infrastructure work focuses on CI/CD and namespace-level Kubernetes deployments; my Terraform and AWS experience is personal and learning-based.

Corvale's train-to-cloud connectivity work calls for reliable, observable infrastructure. I would welcome a conversation about how my delivery-infrastructure experience could support the Fleet Connectivity team.

Kind regards,
Marta Kowal-Brandt
