Dear Corvale Mobility Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. In my current role at Odrava Health Software, I own GitLab CI pipelines supporting three product teams and have built short-lived, Kubernetes-based test environments. I'm interested in bringing that hands-on infrastructure experience to a team shaping the connection between vehicle systems and cloud services.

A key part of my work has been making infrastructure more reliable and easier for teams to use. I reduced average CI pipeline time from 38 to 14 minutes and cut monthly runner costs by about 30%. I delivered infrastructure-as-code workflows for merge-request environments using Helm on a shared Kubernetes cluster. These environments include the application, PostgreSQL and seeded data, and are removed automatically after merge or 48 hours of inactivity. I also built Python and PostgreSQL tooling with Grafana dashboards to help teams identify flaky tests, and wrote an internal guide to how our CI works, which is used in team onboarding. I mentored two QA interns in 2023.

Alongside my professional work, I've built a three-node k3s homelab, deploying applications through Argo CD and setting up Prometheus, Grafana, Loki, Traefik and cert-manager. This also gave me practical exposure to TLS certificate management and ingress configuration. I've also provisioned a small Hetzner VPS using Terraform. I have also completed basic AWS free-tier learning activities using EC2 and S3. My Kubernetes work at Odrava has been at namespace level on a shared cluster operated by the platform team, with my focus on Helm-based test environments, CI/CD integration, and supporting tooling. This has given me practical experience in CI/CD infrastructure, ephemeral environments, observability, and automation, while my personal homelab and Hetzner work have extended that experience into GitOps and Terraform. I would bring that practical experience, a strong testing and automation background, and a careful approach to learning the broader cloud and networking requirements of this role.

The combination of pipeline optimisation, flaky-test analysis, monitoring dashboards, and automated environment cleanup has strengthened my focus on reliable, observable systems.

Corvale's engineering-led approach and emphasis on teams taking ownership of their systems appeal to me. I'd welcome the opportunity to discuss how my experience building and improving infrastructure for product teams could contribute to the Fleet Connectivity platform.

Thank you for your time and consideration.

Marta Kowal-Brandt
