Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. My work has increasingly centered on DevOps and platform engineering, particularly CI/CD pipelines and Kubernetes-based test environments. The opportunity to help build the infrastructure connecting a new train fleet with backend services is a compelling fit for that experience.

At Odrava Health Software, I own GitLab CI pipelines for three product teams and built merge-request environments deployed with Helm to a shared Kubernetes cluster. Automating their lifecycle gave teams a place to review features and run end-to-end tests, while my pipeline improvements reduced average run time from 38 to 14 minutes and monthly CI runner cost by about 30%. I have also documented how our CI works for onboarding and mentored two QA interns, experience that has helped me make technical work easier for others to understand and use.

My infrastructure experience also includes a personal three-node k3s homelab deployed through GitOps, with Prometheus, Grafana, Loki, Traefik, and cert-manager for TLS. I used Terraform to provision infrastructure for a small Hetzner VPS, and have basic personal learning experience with AWS EC2 and S3. My professional Kubernetes work is scoped to namespace-level access and test environments; the shared cluster itself is operated by a platform team. I am currently preparing for the CKA exam, scheduled for January 2027.

Corvale's work to connect onboard systems with cloud services brings together infrastructure, observability, and reliable delivery in a concrete operational setting. I would welcome the opportunity to discuss how my experience building and improving CI and test infrastructure could contribute to the fleet connectivity work.

Kind regards, Marta Kowal-Brandt
