Dear Hiring Team,

I am applying for the Backend Engineer position on Tessel Cargo Software's Routing & Tracking team. I bring seven years of professional backend experience, primarily building and operating Java/Spring services, with hands-on work in REST APIs, event-driven systems, performance tuning, automated testing, and cloud deployments. Tessel's focus on dependable shipment tracking and clear, timely information is a strong match for the production services I have worked on.

At Tejo Insurance Tech, I develop and maintain seven Java 17/Spring Boot microservices for policy quoting and claims intake. I designed and versioned a REST API used by 12 broker partners, and built Kafka producers and consumers for claims workflows. Introducing idempotent consumers and an outbox table eliminated duplicate claim records. I also reduced quote API p99 latency from 1.8 seconds to 450 milliseconds by adding Redis caching and addressing JPA N+1 queries—experience I would bring to improving the performance and reliability of Tessel's tracking platform.

My background also includes deploying services to Kubernetes on AWS through Helm and Jenkins, participating in a monthly on-call rotation, and writing integration tests with Testcontainers. Earlier, I built booking and payment features backed by Oracle and helped extract a notifications service using Spring Boot and RabbitMQ. Java is my primary backend language; my experience with production services and event processing provides a strong foundation for working in a Python-based environment.

I am particularly interested in the team's ownership of event ingestion and tracking APIs, as well as its emphasis on reliability, concise design notes, and clear communication. I would welcome the opportunity to discuss how my backend experience could contribute to Tessel's Routing & Tracking platform.

Yours sincerely,

Daniel Okafor-Reyes
