Dear Hiring Manager,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. My production backend experience is in Java and Kotlin, and I am keen to move into Python-focused backend work. I have also used Python for scripts, including data fixes and small Jenkins helpers.

At Tejo Insurance Tech, I designed a versioned REST API for broker quote requests that now supports 12 partners and around 400,000 requests per month. I also addressed duplicate claim records caused by at-least-once Kafka delivery with a transactional outbox and idempotent consumers; duplicates fell from around 40 per week to zero over the following quarter. These projects have involved API design, PostgreSQL, event-driven services, and reliability in production.

I have also worked on automated testing and service extraction: at Viajar Online, I raised payments-module test coverage from 35% to 70% with Testcontainers and extracted notifications from a Java monolith into a Spring Boot service. In my current role, I participate in on-call and handled a Kafka lag incident in March 2024. The role's focus on event ingestion, Kafka streams, tracking API reliability, and production support is a strong match for this experience.

Tessel's work on dependable live shipment tracking and its focus on engineers owning and running their services particularly appeal to me. I would welcome the opportunity to discuss how my backend experience could contribute to the Routing & Tracking team.

Best regards,
Daniel Okafor-Reyes
