Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer – Data Platform role. I bring nine years of experience building and operating data platforms across payments, e-commerce and logistics, with hands-on work in Python, SQL, Airflow, dbt, cloud warehouses and streaming systems.

At Lukovac Freight Hub, I own ingestion and orchestration for the data platform and have focused on making it more reliable and easier to operate. I migrated approximately 300 stored procedures into tested and documented dbt models, reducing the nightly warehouse build from 5 hours 10 minutes to 1 hour 35 minutes. I also introduced data contracts with CI checks and built a Kafka-based shipment-event pipeline processing around 30 million events per day. These projects reflect the ownership, clear standards and reduction of unnecessary complexity that Halden Pay describes.

Earlier, at Kovalent Pay, I built PySpark jobs on AWS EMR for transaction reconciliation, processing around 1.2 TB of raw files daily, and designed a dimensional Redshift warehouse with more than 30 fact and dimension tables for finance and risk. I also set up Great Expectations checks for critical finance data. This experience gives me a practical foundation in financial data platforms and cloud services comparable to the Google Cloud environment in your stack. I have also contributed two merged pull requests to an Airflow provider and presented on data contracts at a regional data meetup.

I would welcome the opportunity to discuss how my experience building dependable data platforms and working across data and product needs could contribute to Halden Pay’s Data Platform team.

Kind regards,
Lena Varga-Holm
