Dear Corvale Mobility Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. My experience combines CI/CD ownership and test-infrastructure engineering with Helm-based, namespace-level test environments on a shared Kubernetes cluster, GitOps, and Terraform-based personal infrastructure, and I'm interested in applying that background to reliable, observable systems that connect vehicles with cloud services.

At Odrava Health Software, I own GitLab CI pipelines for three product teams of around 25 developers. By profiling and parallelising jobs, adding dependency caching, and separating end-to-end tests into their own stage, I reduced average pipeline time from 38 minutes to 14 and monthly runner costs by about 30%. I also built short-lived merge-request environments using Docker Compose and later Helm on the company's shared Kubernetes cluster. These environments let QA and product teams review changes and run end-to-end tests before merge, with automatic cleanup after merge or inactivity. By enabling QA and product teams to review features and run end-to-end tests before merge, I helped multiple stakeholders adopt a shared delivery workflow.

My infrastructure experience includes building Helm-based, namespace-level test environments on a shared Kubernetes cluster at Odrava, alongside personal k3s and Hetzner VPS projects, with the VPS provisioned using Terraform. In my personal three-node k3s homelab, deployed with GitOps through Argo CD, I configured Prometheus, Grafana, Loki, Traefik ingress, and cert-manager for observable services and TLS certificate management. I also have foundational AWS exposure through personal learning with EC2 and S3. My experience also includes Linux-based development and infrastructure work. I also wrote the internal guide to our CI system used in onboarding and mentored two QA interns, helping teams adopt shared technical practices.

My approach is to use measurable evidence to improve reliability: I profiled pipelines across three teams, reduced execution time from 38 to 14 minutes, lowered runner costs by about 30%, and helped reduce flaky tests from 7% to below 2% through CI reporting and Grafana dashboards.

Corvale's focus on taking the new fleet's connectivity platform from architecture through production appeals to me. I would bring a practical, evidence-driven approach to automation, observability, TLS certificate automation with cert-manager, and reliable operations while contributing to the platform's evolution from design into production. Thank you for considering my application. I would welcome the opportunity to discuss how my background could contribute to the team.

Kind regards,
