Nadia Brennan-Aziz

Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role on the Fleet Connectivity team. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and hands-on experience designing and running cloud infrastructure with Terraform.

At Tallybrook, I'm the tech lead for a five-person platform team operating EKS across eight clusters and three regions. I led an internal developer platform adopted by all 14 product teams, helping reduce the time to take a new service to production from about two weeks to under one day. I also introduced SLOs and error budgets with product leadership, and established incident and post-mortem practices. This work has meant turning technical proposals into practical platform capabilities and bringing teams along with the decisions.

Previously, at Brightwater Games, I managed AWS infrastructure through approximately 40 Terraform modules, using Atlantis for pull-request plan and apply workflows. I replaced a noisy Nagios setup with a Prometheus-based observability stack and used k6 testing and launch-day capacity planning to prepare for major launches. One test simulating 300,000 concurrent players exposed a connection-pool limit that we fixed before launch. That combination of infrastructure engineering, analytical problem-solving and operational preparation is relevant to building a reliable, observable connection between onboard systems and cloud services.

Corvale's plan to shape the architecture for a new generation of trains and take it through to production particularly appeals to me. I would welcome the opportunity to discuss how my experience leading platform work and supporting product teams could contribute to the Fleet Connectivity team.

Best wishes,
