Dear Corvale Mobility hiring team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. I bring 10 years of infrastructure experience, including designing and operating AWS platforms, building reliable deployment paths for product teams, and leading technical work from proposal through production.

At Tallybrook, I am the tech lead for the platform team operating an EKS environment across eight clusters and three regions. I built an internal developer platform using service templates, Argo CD and Crossplane, now adopted by all 14 product teams. This reduced the path from a new service to production from approximately two weeks to under one day. I also introduced SLOs and burn-rate alerts for critical services, reducing weekly on-call pages by approximately 60%, and led a Karpenter and Spot migration that cut EC2 spend by 38%.

My earlier work at Brightwater Games included managing AWS infrastructure in Terraform across approximately 40 modules, introducing Atlantis workflows for pull requests, and improving observability with Prometheus, Grafana, Alertmanager and Loki. I also led capacity planning and load testing for game launches. These experiences are relevant to Corvale's need for dependable cloud infrastructure, approachable infrastructure as code, and services that backend developers can monitor and operate effectively. I am used to leading technical topics and working with product teams to agree practical reliability policies.

The opportunity to help shape infrastructure for Corvale's new train fleet, from system design through production, is a compelling application of that platform and reliability experience. I would welcome the opportunity to discuss how I could contribute to the team.

Best wishes,
Nadia Brennan-Aziz
